

The natural choice for biological control

DeCyst is a commercially proven trap crop for the control of potato cyst nematode, delivering real advantages for the professional potato grower:

- Completely natural
- Safe to the environment
- Very effective at reducing both *G. rostochiensis* & *G. pallida* species of nematode
- Contributes up to 12 tonne/ha of green manure
- Suitable for all soils including peat and sands.

With new practical production techniques developed by Produce Solutions, growers have successfully grown over 250 hectares of DeCyst in 2021. Initial results indicate expected reductions of 80% in PCN levels.

DeCyst does not produce tubers and can be grown anywhere in the rotation. It is best drilled into a fine, firm seedbed between mid-May and the end of June - using a cereal or precision drill. It is simple to destroy by chopping and ploughing at a convenient time in October/November.

*We are now taking DeCyst orders for
delivery in Spring 2022.*

*For assured availability, early
ordering is recommended*
